

I Want Foxy to Step on me

Treddon

Department of Law Enforcement, The Vigilantes

Bell Tower, Labyrinthia

Abstract

I really want Foxy to step on me. It would make my whole life if Foxy would step on me. It feels so good when she digs her vigilante stilettos into the back of my armor. I want to be a footstool for Foxy, letting her use me as she pleases. I want to be her support in court, yelling “Objection” for her and holding her precious stilettos up so she does not tire. When it rains, I want her to imprint her mud-covered footprint onto the back of my armor, marking me as one chosen by her. I would never want to wash my armor to preserve this moment for eternity. It becomes art, how the print remains on the armor, how it beautifully tapers to a point at the end, how the heel point leaves a circular mark so rough but so pleasurable. It becomes poetry, how the mark born from dirt and mud becomes something so much more. Those who do not feel the same are such hopeless men - who would not want to feel the sharp stiletto tips as sharp as Barnham’s sword digging into their back?

Keywords: tread; step; foot; Foxy; submissive; I want Foxy to step on me; vigilantes; footprint

I Want Foxy to Step on me

We live in a society where people can be looked down upon for their interests. Peering into the lives of others is bothersome and offers no benefit to the society as a whole. Mocking another's personal enjoyment solely for the sake of gaining pleasure from another's humiliation only contributes to less social interactions, openness, and exploration of what the world has to offer, culminating in a more unhealthy and undeveloped people. We should not be kinkshamed by those who do not know life's higher pleasures, but encourage those around us to explore all of their options to enrich the excitement of their lives.

Being stepped on is an honorable action. I am showing my loyalty and devotion to the beautiful light of my life by allowing her to place her foot on my back. This paper will show that this thought of mind does not lie solely with me, but with the entire population of Labyrinthia.

Method

We conducted a study to determine whether the citizens of Labyrinthia would like to be stepped on by Foxy. We hypothesize that everyone would love the joy of having Foxy's stiletto shoes dig into their backs because it makes me feel so so good.

Participants

The participants for this study were randomly selected from the citizens of Labyrinthia. We selected 10 participants for this survey. Since everyone else in the city happened to ignore us, the sample selection was smaller than intended, but should have no impact on the final results of the study. The 10 participants were selected randomly from The Vigilantes, as they were the only people that wanted to talk to me. The sample group consisted of 9 males and 1 female participant

ranging from 9 to 63 years of age. As members of The Vigilantes, these members were from the greatest, bravest, foxiest group in all of Labyrinthia, so nothing apart from excellent results can be expected.

Materials

With no access to supplies and no funding to The Vigilantes at all, the materials we used for the survey were ink and quill retrieved from Newton Belduke's study and the reverse side of pages from the Storyteller's newest chapter. The materials used were reliable and without chance of failure - the ink on the pages of the survey are unable to be tampered with or modified, even by a witch, ensuring clear and accurate results. The pages themselves are respected and known throughout the town of Labyrinthia due to the Storyteller's popularity and influence, so they are a reliable vessel of information perfectly suited to this study. There are no covariates to worry about during this study.

Procedure

In this study, the participants were given a simple questionnaire written on the back of a story page and a quill with ink. Participants were instructed to mark their answers clearly in the provided locations and submit the page to the examiner once completed.

Results

With this study, we measured the percentage of people in Labyrinthia that would like to be stepped on by Foxy. Figure 1 shows the responses from the questionnaire, stating that 8 people answered saying they would like to be stepped on by Foxy and 0 saying they would not. Figure 2 transforms this data into an easy to understand pie chart showing the percentage of each response.

Wanting to be Stepped on by Foxy

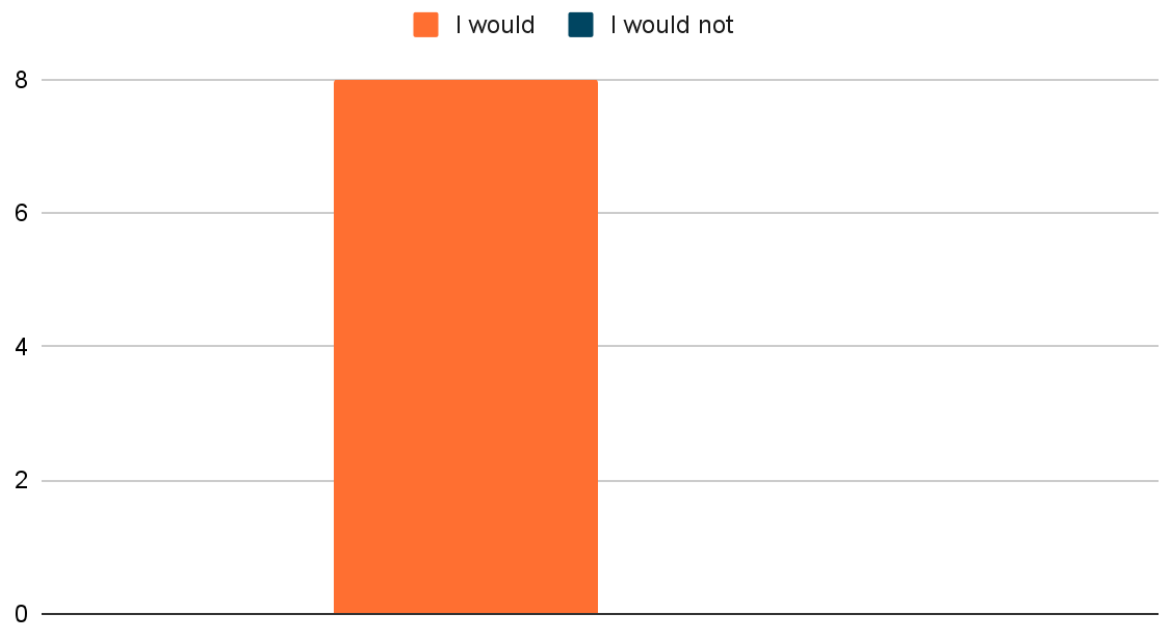

Figure 1: Results of the Survey

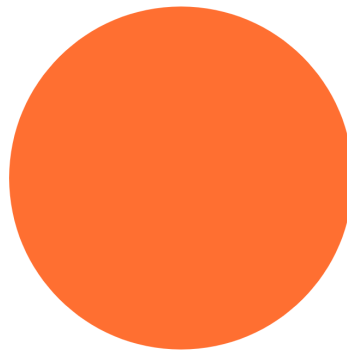

Figure 2: Percentage analysis of the data from Figure 1

Two responses to this survey had to be disregarded in collecting these results due to problems with filling out the questionnaire (one had markings that were all over the place as if the participant couldn't keep their hand steady, so no clear result could be drawn, and another

person seemed to have filled the name field out with random letters, possibly compromising the integrity of the survey).

Discussion

As the results of the survey show, 100 percent of people responded that they wish to be stepped on by Foxy. Since the population selected was an excellent representation of Labyrinthia, it can be shown that everyone in Labyrinthia should hold the same opinion. I can almost feel the shoes on my back as I write this section. The survey also had a spot for participants to write comments about the survey for any feedback they had. These are listed below.

“Aren't you supposed to be watching the bell tower right now Treddon?”

“Foxy asked me to do her survey for her, so being the loyal Vigilante I am, I was happy to agree!”

“Why is there only one answer to your question? Where do I mark for no?”

“A great survey by Treddon who is very deserving of Foxy's feet.”

“Did I just hear something crash on the floor?”

“Nary a worry crosses my mind as my quill flows gracefully across the page.”

The survey was a resounding success among the participants. This questionnaire is especially valid because there was only a single question and one answer choice, eliminating the possibility for variations due to outside causes.

Method 2

We conducted a second study to further determine the benefits of being stepped on by Foxy. We hypothesize that distance from Foxy has an inverse relationship with happiness. This is

a pretty self-explanatory statement, but we decided to conduct an experiment anyway in order to prove it.

Participants

After the last experiment, only 1 other Vigilante would listen to me, so the participants for this study were 2 randomly selected people from the group of us 2. The selected participants were both male, ranging from 25 to 26 years of age.

Materials

Only 1 material was needed for carrying out this study - Foxy. We could not find any more materials, so for the recording of data, we used the leftover pages, ink, and quills from the last study.

Procedure

As the participants approached Foxy, they recorded their position and level of happiness/excitement. A second onlooker also recorded the expressed emotions of the participant as well in the case where the participant was too infatuated or distracted to make any records of their own.

Results

With this study, we measured the happiness level of 2 people as the neared Foxy. Figure 3 shows the responses of the two participants during the study. The graph, however, is incomplete, as there was not a label high enough possible to summarize the words written by the participant shown by the red line when Foxy stepped on him. We did our best to show this result with the exponential curve that continues to infinity of the y axis.

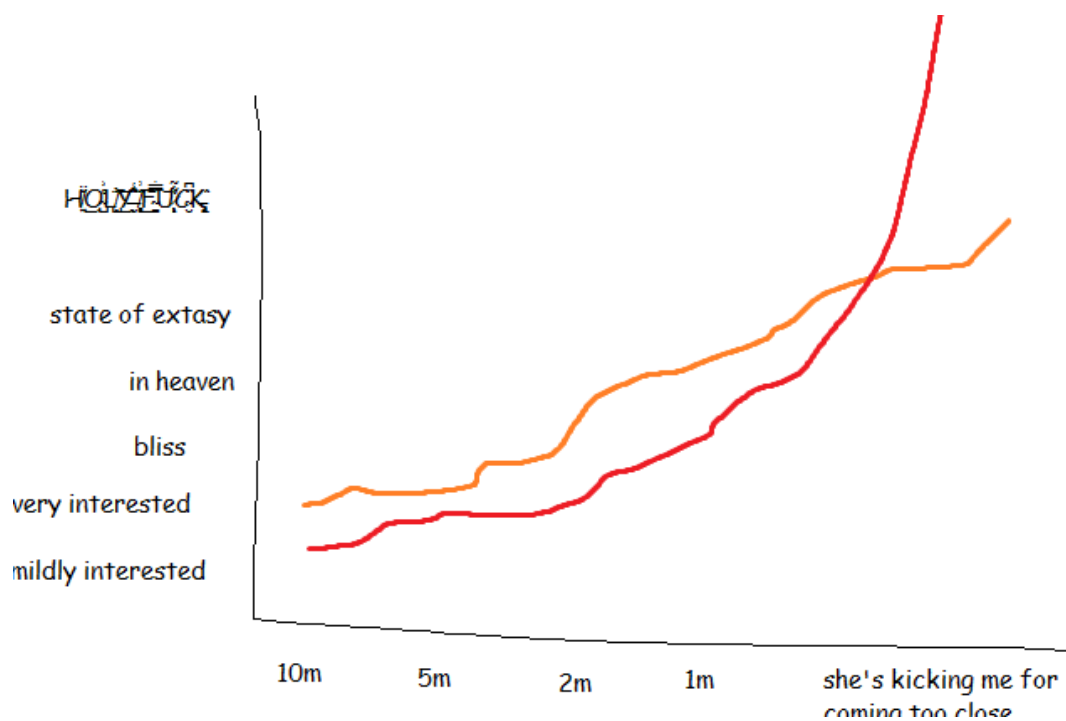

Figure 3: Happiness vs Distance from Foxy

Discussion

I need to be stepped on please step on me oh god I need it look at the pretty lines they show the results that Foxy should step on me. You can interpret this graph as “Foxy needs to step on me right now.” It is for the good of this great society of Labyrinthia that I get stepped on. It would increase the total happiness of the world if Foxy would step on me since I would be so happy to be stepped on and she would gain pleasure from stepping on me. There would be no point to not step on me, so what are we waiting for??

Conclusion

Oh please Foxy please step on me I made this whole paper to prove that it is good please step on me.
